

Case Study: AI-Powered Compliance Document Intelligence Platform

Industry: Finance / Regulatory Compliance

Service Delivered: AI-Powered Document Intelligence Web Platform

Overview

A financial services firm approached **Softcode Technologies** to build a smart platform for their **compliance officers**, who deal with thousands of regulatory documents from authorities like the **RBI, banks, and financial institutions**.

The goal was to reduce the **manual effort** required to review, track, and extract key action items from massive sets of compliance documents. Our team delivered an **AI-driven platform** that could parse, interpret, and **extract knowledge from unstructured text** — surfacing crucial information like **due dates, last modified dates, responsible departments**, and more.

Objectives

The platform was envisioned to:

-  Ingest and process **12,000+ RBI and financial regulatory documents**
-  Use **AI/NLP** to extract action items, deadlines, and context
-  Allow **smart document search** based on queries or keywords
-  Notify users about **upcoming deadlines or pending compliance tasks**
-  Provide **secure access** to compliance officers across departments

Challenges

Unstructured Regulatory Text

Documents were long, complex, and lacked a standard structure — making traditional search unreliable.

Deadline & Action Extraction

Identifying dates, owners, and compliance instructions hidden deep in regulatory language required advanced NLP models.

Document Volume & Organization

Over 12,000 documents needed to be indexed and categorized efficiently, with metadata attached automatically.

Access & Sensitivity

Compliance data is sensitive. The platform had to ensure secure access, logging, and audit trails.

Our Solution

Softcode delivered a **robust web-based platform** with AI/NLP capabilities that empowered compliance officers to **search, track, and manage** regulatory actions.

Text-to-Knowledge AI Engine

- Extracted **action items, responsibilities, due dates, and modification dates** from raw PDF/DOC formats
- Used **Named Entity Recognition (NER)** and **custom models** fine-tuned on financial language

Smart Document Search

- Allowed users to **search by topic, clause, keyword, or date**
- Returned not just documents — but **direct insights** with matched sentences and extracted metadata

Auto Categorization

- Documents were grouped by **regulatory type, issuing authority, date, and urgency**
- Enabled easy filtering and sorting for busy officers

Action Tracker and Reminders

- Auto-generated compliance calendars and flagged upcoming or missed deadlines
- Option to assign items to departments with status tracking

User Roles and Audit Trail

- Only authorized users could access certain categories or take actions
- Every search, view, and edit was **logged for traceability**

Results

- ✓ **80% Reduction** in time spent searching documents manually
-  **Increased Compliance Accuracy** with fewer missed deadlines and overlooked clauses
-  **Continuous Learning** — AI models improved with ongoing document uploads
-  **Actionable Insights** surfaced directly, allowing officers to act faster and with greater confidence

Client Testimonial

"Softcode helped us modernize how we manage compliance. What once took hours of manual reading and cross-checking can now be done in seconds. The platform has become a critical part of our compliance operations."

Conclusion

This project highlights how Softcode leverages **AI, NLP, and intuitive UI** to solve complex real-world challenges. By turning unstructured regulatory text into structured knowledge, we empowered compliance teams to **stay ahead of deadlines, reduce risk, and ensure full transparency** across the organization.
